## **Fetal Cardiology for Obstetricians and Fetal Medicine Specialists 2018**

- Now in its 2<sup>nd</sup> year, this two-day course aims to provide Obstetricians and Fetal Medicine Specialists with an update on fetal cardiology topics which are relevant to management of high-risk pregnancies.
- The course maintains its initial format, including ultrasound evaluation of specific forms of congenital heart disease as seen in the fetus, pregnancy management and update on postnatal outcome. Quiz sessions throughout the course provide delegates with challenging ultrasound images to test their diagnostic skills, and are discussed in an interactive way.
- A new session on case discussion will be presented by the Faculty but we also encourage delegates to submit their own cases for discussion. Selected cases will be presented by the delegate and discussed by a panel of specialists.
- The course is primarily aimed at obstetricians and fetal medicine specialists but is also suitable for paediatric and fetal cardiologists and other professionals dealing with management of high-risk pregnancies.

### **Course Objectives**

- To improve delegates' understanding of congenital heart disease
- To enable delegates to scan fetal heart abnormalities with confidence
- To enable delegates to manage fetal heart abnormalities within the context of fetal medicine.
- To improve delegates' knowledge of postnatal outcome of congenital heart disease
